

Our Practice utilizes much of the latest new technology available in the dental field:

- ***Schick Digital X-ray system.*** Dental X-rays taken using a **digital X-ray sensor** provide the patient with up to 80% lower radiation exposures than traditional high speed dental films. These modern digitally produced radiographic images are instantly developed and can be easily emailed to specialists or dentists for second opinions.

Rediscover the Passion for Your Profession

- ***Isolite Systems.*** With Isolite, patients don't have to strain to keep their mouth open the entire procedure. The built-in bite block allows the patient to comfortably rest their jaw while keeping their mouth open at all times. *It's the convergence of retraction, protection, aspiration and illumination that make Isolite such a powerful addition to our practice. That combination translates to quick, easy, reliable isolation and moisture control; with the patented Isolite mouthpiece the Doctor gets virtually uninterrupted access to the oral field which means faster, more comfortable procedures!*

- ***High-speed electric drills which save time and cut smoothly without much vibration.*** Electric drills have been making and impact on American dentistry. Although their rpm's are slower with only a maximum speed of 100,000 rpms, they cut with more torque and less chatter. These characteristics mean that they cut faster and smoother with less noise and vibration. Patients have reported them to be more comfortable than the traditional high speed air turbine. They speed the process without any sacrifice in quality.
- ***Intra-oral camera*** sometimes a picture tells more than a thousand words! Some patients need to see the truth to believe the truth. The intra-oral pictures enable an open discussion with the patients about their dental health and help them to make an informed decision.
- ***Nitrous Oxide*** which assist us in treating patients with dental anxiety.
